

# AbleSpace - Part 2: Product Understanding

## Caseload -> Take Data workflow and UX/UI review

This document explains the visible AbleSpace Caseload workflow from the assessment reference and records practical UX/UI and functionality improvements identified from the screen.

| Dwight Schrute  | Schrute   | -          | -          | [Icons]       | 0                   |               | Take Data |

Submit either a document with screenshots explaining the workflow in your own words or a video walkthrough. Share any UX/UI or functionality improvements you identify.

**Submission Guidelines**  
Submit within 14 days. Review may take up to one month. Provide a public GitHub repository with multiple small, meaningful commits, a working deployed live URL

Assessment reference: Caseload screen showing student rows and the row-level Take Data action.

## 1. Workflow in my own words

| Step | Action                     | Explanation                                                                                                                               |
|------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Open the Caseload area     | The Caseload screen acts as the central list of students and their relevant service information.                                          |
| 2    | Locate the student         | Use the visible student list and search field to find the required student record.                                                        |
| 3    | Review the row context     | Before starting an action, the row exposes useful context such as IEP Due, Eval Due, collaborators, service time and school.              |
| 4    | Start Take Data            | The Take Data button in the Actions column provides a direct entry point for starting data collection for that student.                   |
| 5    | Continue the data workflow | The action should preserve the selected student context so the user can continue data collection without needing to relocate the student. |

## 2. UX/UI observations

- The Caseload screen exposes the most important student context in one horizontal row, reducing the need to open multiple screens before starting an action.
- The Take Data button is placed in the Actions column, making the primary action easy to associate with the selected student.

- The search field is useful for large caseloads and should remain visible and easy to access.
- The table is information-dense, so hierarchy, column alignment and whitespace are important for scanability.
- Collaborator avatars provide compact context without consuming the space of full names.

### 3. Suggested improvements

**Clear action feedback** - Show a loading/progress state immediately after Take Data is selected and provide a clear success or error message.

**Student context confirmation** - Show the selected student's name prominently at the start of the data workflow to reduce the risk of collecting data for the wrong student.

**Keyboard accessibility** - Ensure Take Data and row actions are fully keyboard accessible with visible focus states and meaningful labels.

**Advanced filtering** - Add filters for school, service time, due dates and assignment status so large caseloads can be narrowed quickly.

**Responsive behavior** - On smaller screens, use a responsive card representation or controlled horizontal scrolling while keeping the Take Data action visible.

**Loading and empty states** - Provide clear skeleton/loading, no-results and error states for the student list.

**Action consistency** - Keep the primary Take Data action visually distinct from secondary row actions and maintain consistent hover/focus states.

### 4. Product-thinking summary

The strongest part of the workflow is the proximity between student context and the Take Data action. For a frequent operational workflow, minimizing navigation and keeping the selected-student context visible helps reduce errors and speeds up repeated data-entry work. The main opportunities are accessibility, feedback, responsive behavior and better filtering for larger caseloads.

Prepared for the AbleSpace Full Stack Developer technical assessment.
